Smart Grid Coordination Group presents new Working Group reports:

The Working Groups are preparing their reports.

The Working Groups (WG) of the Smart Grid Coordination Group (SGCG) presented an update on their activities on the Smart Grid International Plenary.

A result will be final reports which are currently created. These reports will be one of the pillars of the standardization effort of the EU.

The reports of WG Reference Architecture, Smart Grid Information Security and WG Sustainable Processes and the Framework document of the Coordination Group provide an overview of the activities and reports of the SGCG and their working groups, describing how the individual elements and reports fit together providing a consistent framework.

Not only the relationships between the SG-CG working groups and their contribution to the overall picture are explained but also the used processes and the systematical approach to standardisation in a Smart Grid.

FINSENY has supported this EU initiative and e.g. contributed all its use cases to the report of the Working Group Sustainable Processes.

This report and the further improvement of use cases will be one of the pillars of the standardization effort of the EU.

Also the presentations of the International Plenary of the Smart Grid Coordination Group from 18.6. and 19.6. is available for download:
